

Why Eclipse Kura and Eclipse Kapua treat EdgeOps headaches better than ibuprofen?

Motivation

“Data is the new oil” - Clive Humby

Edge and **IoT** systems maximize the amount of data we can capture.

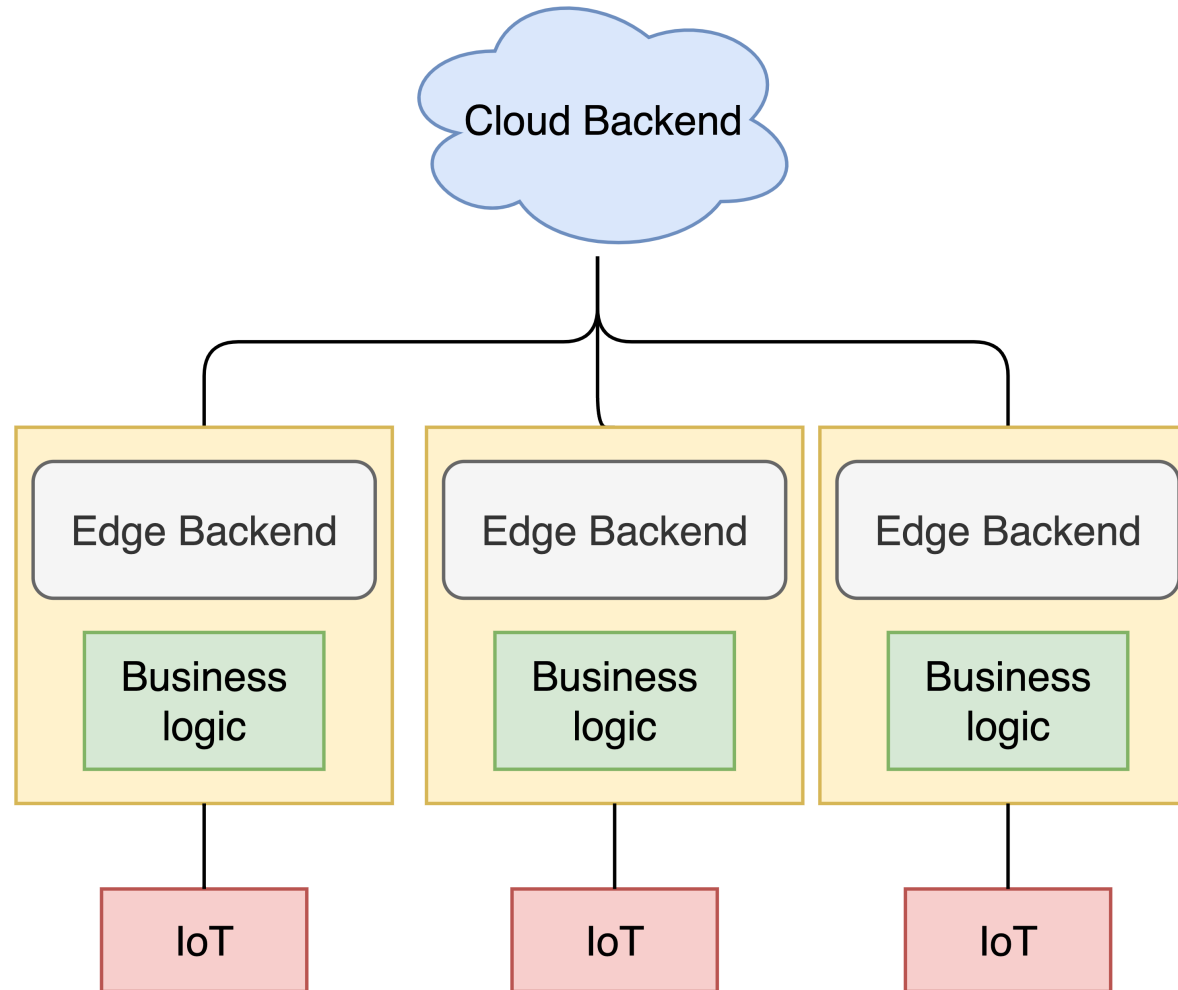

Why start from scratch when good **Edge** frameworks already exist?

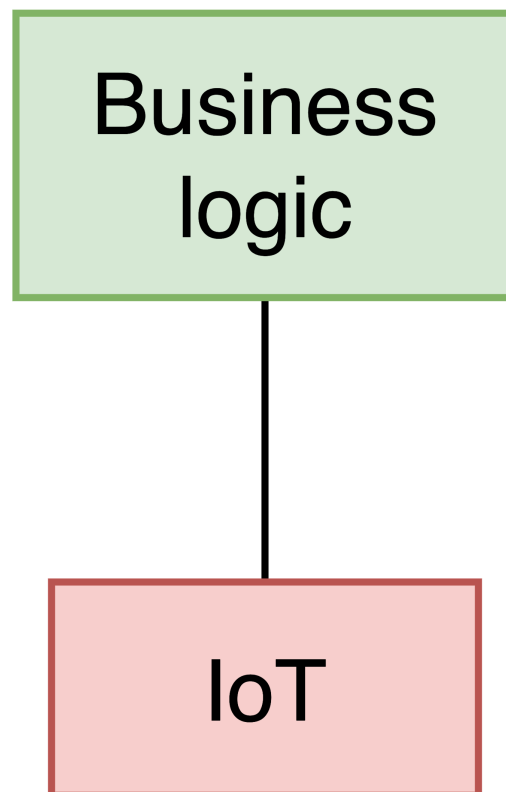

Isn't business logic enough of a headache on its own?

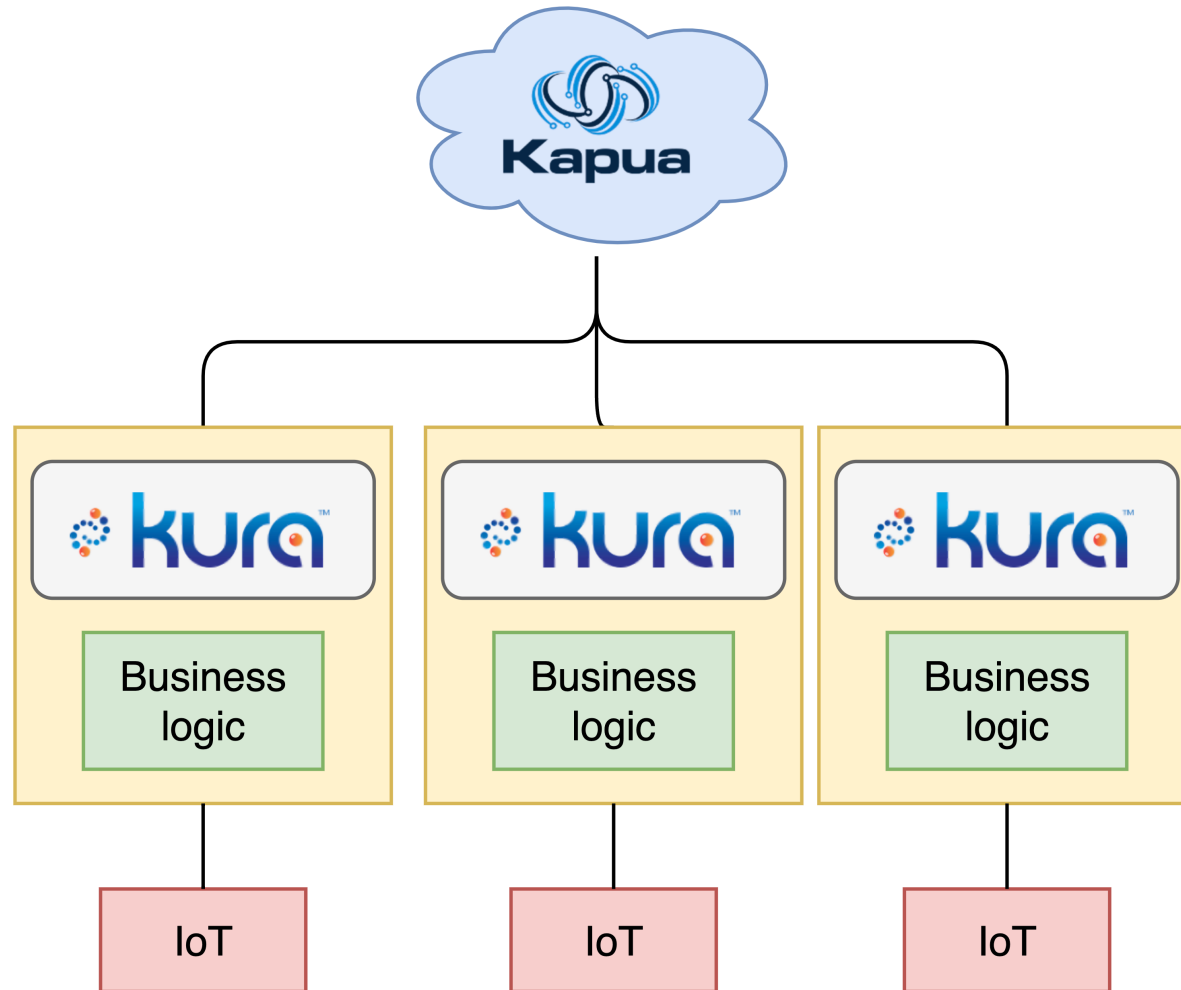

What you need to build your own Edge from scratch

What you need to build when using Eclipse Kura & Kapua

Why? – Kura & Kapua have your backend solved.

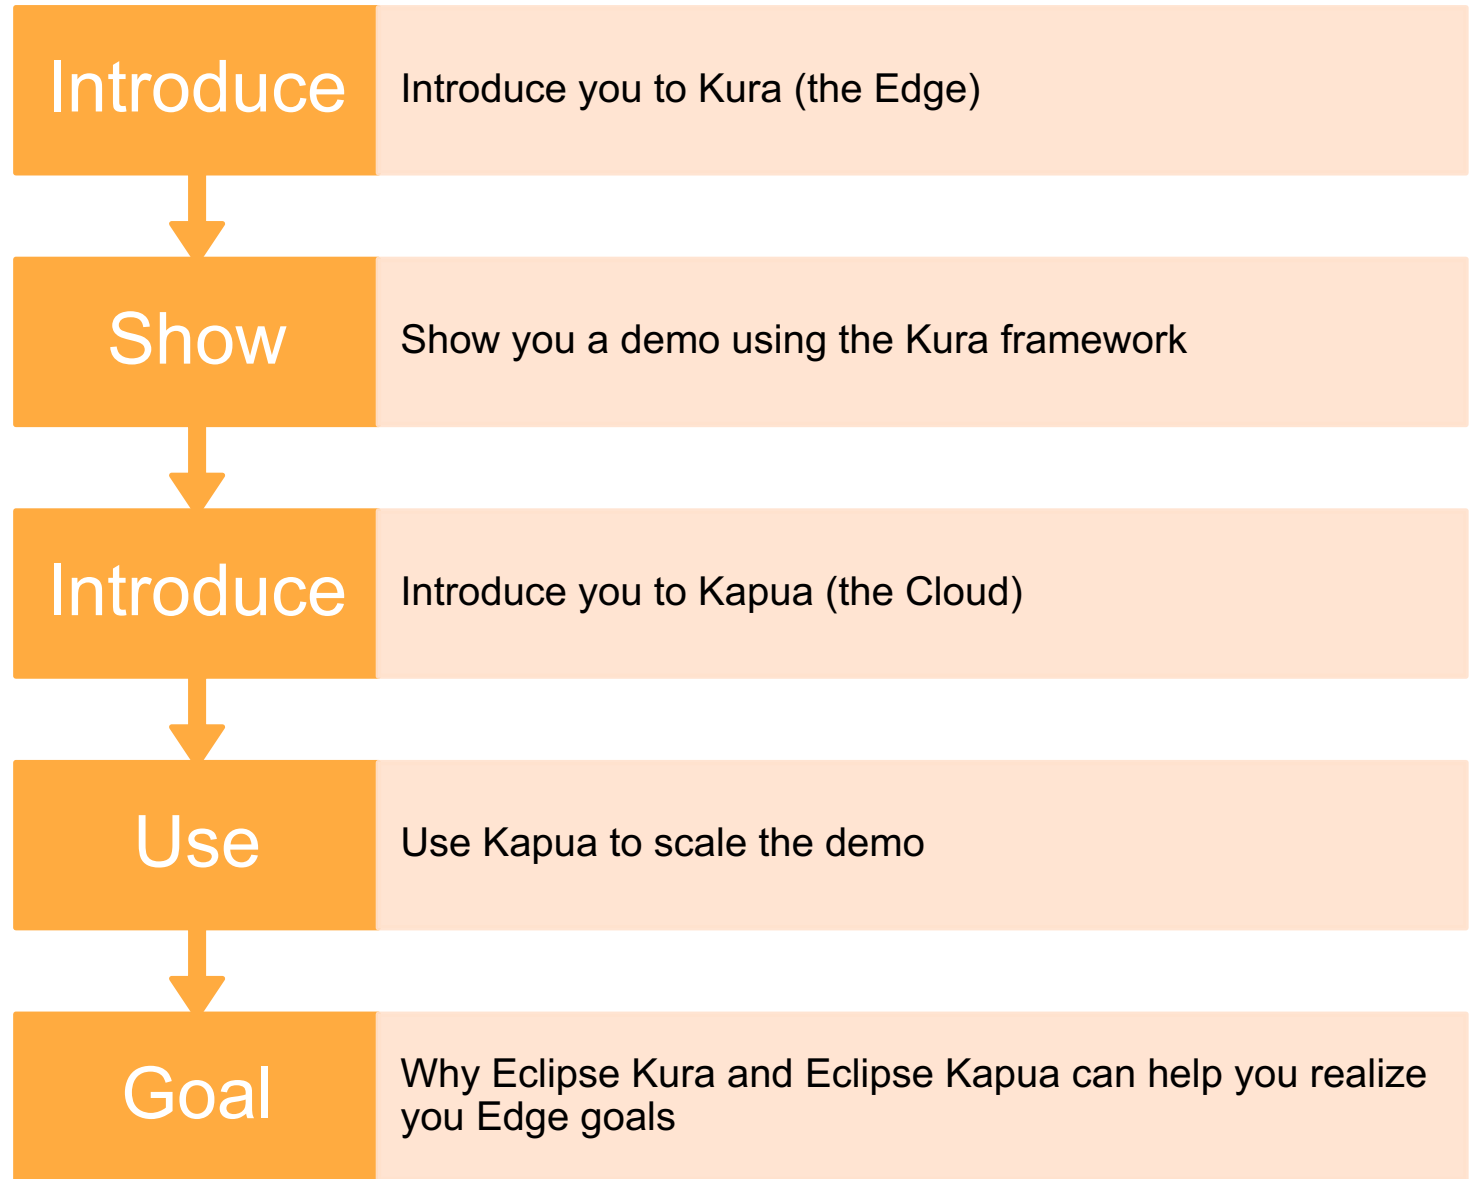

\$ whoami : Gregory Ivo

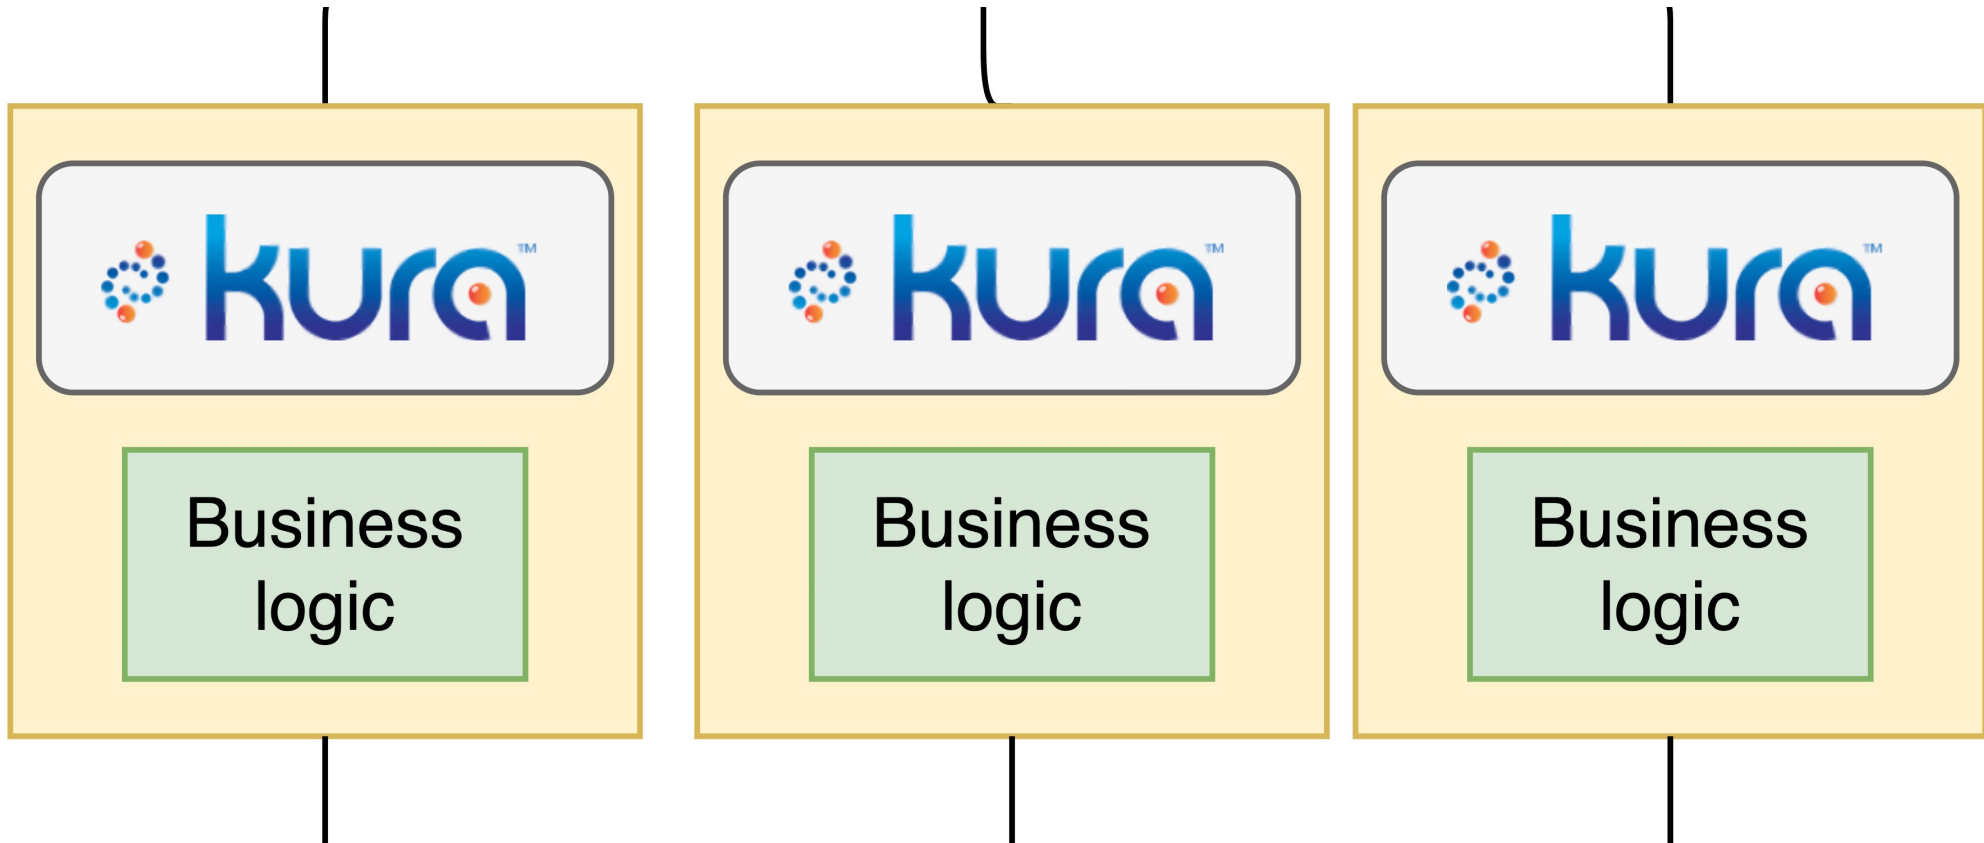

- Currently ESF/Kura Engineer at Eurotech inc.
- Intern @ Eclipse in 2021
- Graduated from the University of Ottawa, Canada (BASC Computer Engineering) – December 2022

Agenda

Let's start With the Edge

What is

kura™

EDGE FRAMEWORK
THAT RUNS ON
CONFINED DEVICES
(I.E. RASPBERRY PI)

KURA-WIRES ALLOWS
USERS TO VISUALLY
PROGRAM DATA
FLOWS

ORCHESTRATES
CONTAINERS

SENDS & ACCEPTS
MQTT DATA STREAMS

SAFELY STORES
CONFIGURATIONS &
SECRETS

USER FRIENDLY WEB
ACCESSIBLE UI

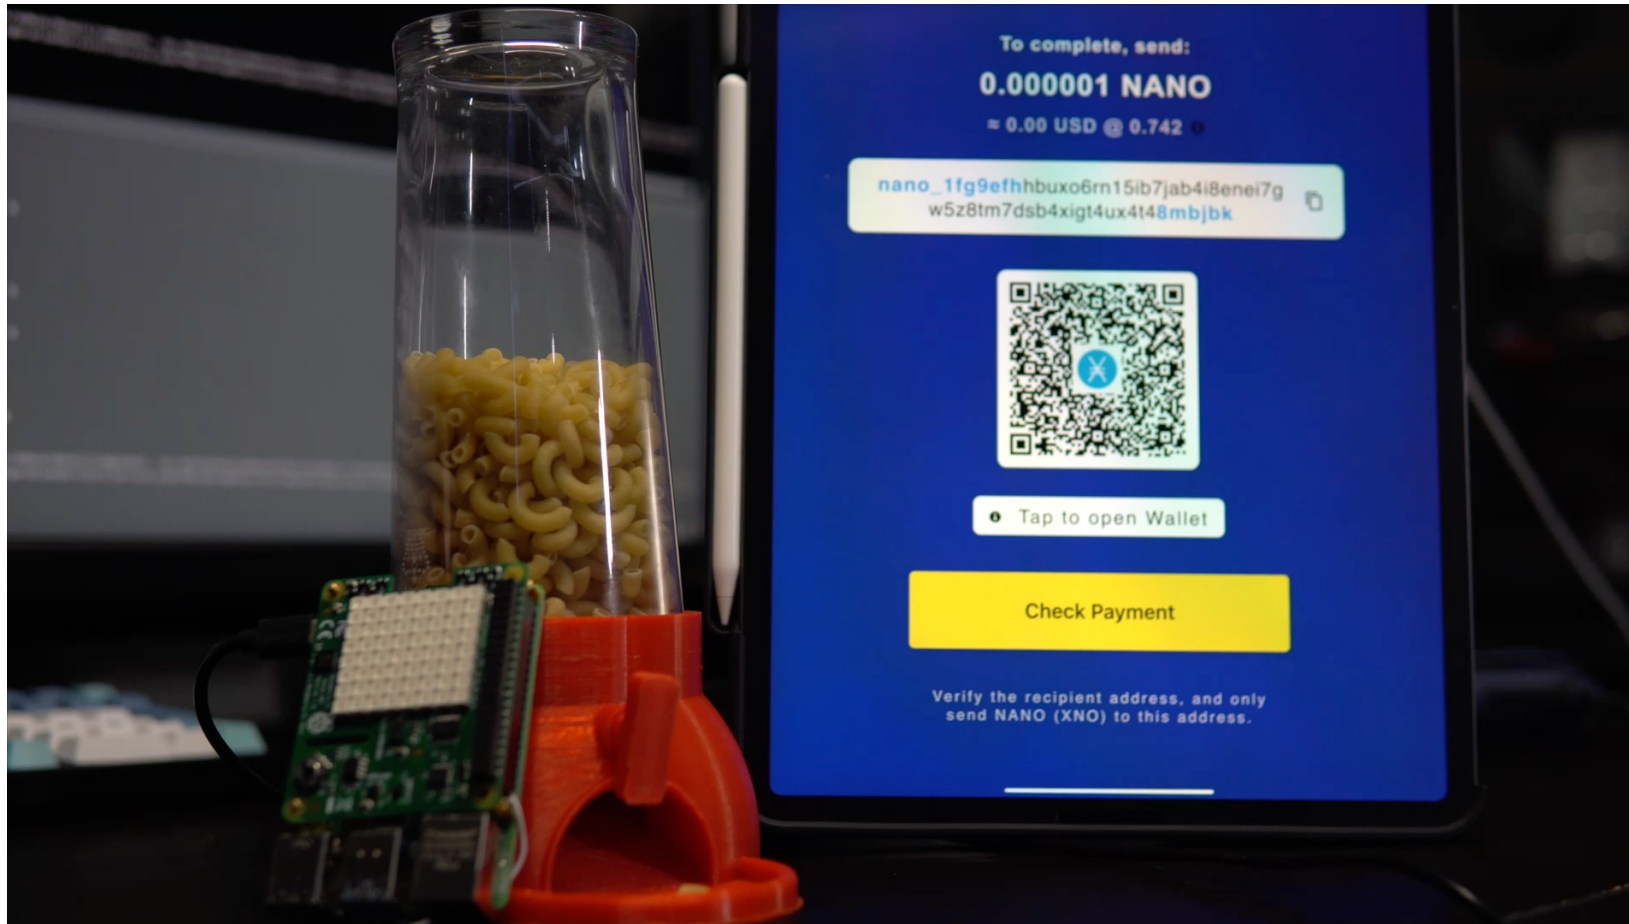

Set the Scene – The Kura Candy Machine

Let's make a Candy machine with the following Criteria:

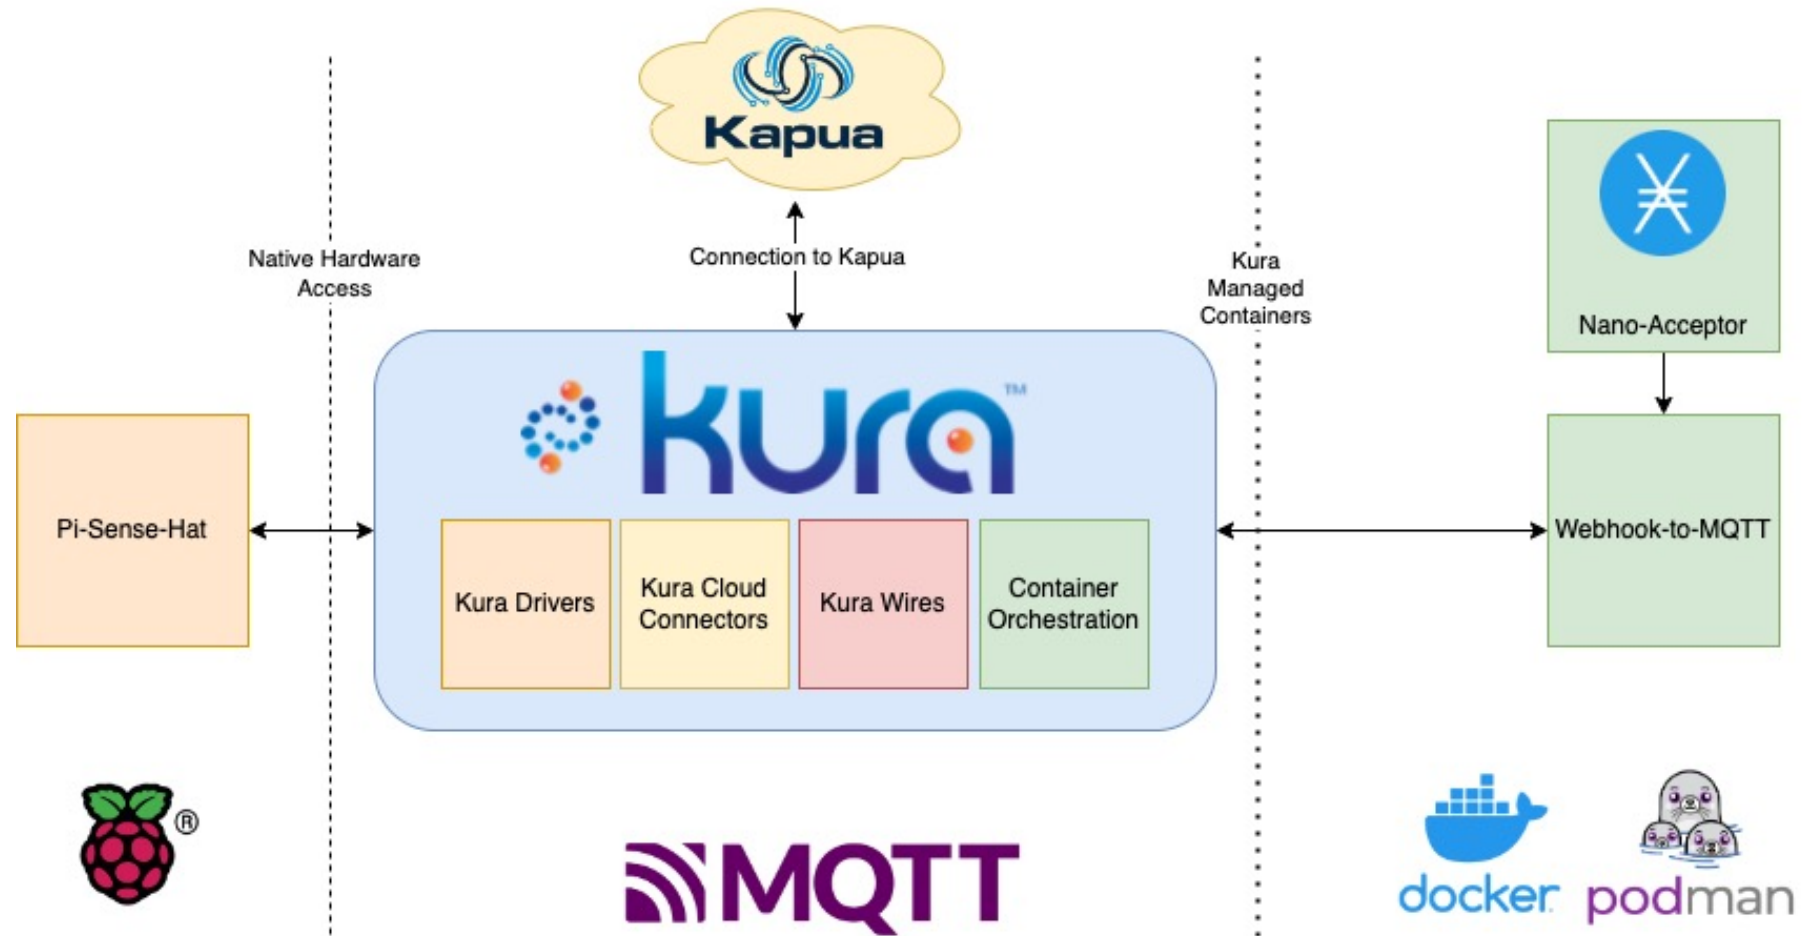

1. Accepts payment and dispenses something of value in return;
2. Detects when someone is trying to tamper with it;
3. Reports data back to the cloud (i.e. when a sale is made and if has been tampered with); and,
4. Is easily scalable so that the company can deploy as many machines as necessary.

The Demo

How our Gumball machine works?

How Kura Helped Build It?

Kura – Container Manager/Orchestrator

- Interfaces with Docker/Podman and manages containers for you
- Containers are language agnostic – Run anything on top of Kura
- Kura Container Dashboard

Device

Summary information about the current hardware and software configuration of this device.

Profile Bundles **Containers** Threads System Packages System Properties Command System Logs

▶ Start Container ■ Stop Container ↻ Refresh

Asset Type	ID	State	Name	Version	Framework Managed
Containers	nano-paymentConnector	Active	geevo/nanopaymentconnector	latest	true
Images	nano-websocketMQtt	Active	heleon19/http-mqtt-bridge	latest	true

Kura – Container Manager Cont.

ContainerInstance - nano-paymentConnector

Allows for the creation of containers.

✓ Apply × Reset

🗑 Delete

Enabled*

Enables this container

true false

Image name*

The image the container will be created with. The value will need to be expressed in the form registryURL/imagename in case of a custom registry. Please fill the following registry credentials in case of pulling from a custom or authenticated Docker hub registry.

geevo/nanopaymentconnector

Image tag*

ContainerInstance - nano-websocketMQtt

Allows for the creation of containers.

✓ Apply × Reset

🗑 Delete

Enabled*

Enables this container

true false

Image name*

The image the container will be created with. The value will need to be expressed in the form registryURL/imagename in case of a custom registry. Please fill the following registry credentials in case of pulling from a custom or authenticated Docker hub registry.

heleon19/http-mqtt-bridge

Image tag*

Authentication Registry URL

Url for docker registry. Required only for authenticated registries

Authentication Username

Username for container registry. Required only for authenticated registries

Password

Password for container registry. Required only for authenticated registries

Image Download Retries *

The number of retries to pull the container image. Set to 0 for unlimited retries

Image Download Retry Interval *

The interval (in milliseconds) between retries to pull the container image

Image Download Timeout *

Image download timeout. Value specified in seconds

Internal Ports

A comma-separated list of ports. If no protocol is specified tcp will be used. Note, the number of internal ports must be equal to the number of external ports. A port internet protocol can also be specified with a colon and text after the port number. Example: 80, 443:udp, 8080:tcp.

External Ports

A comma separated list of ports. Note, the number of external ports must be equal to the number of internal ports. Example: 8080, 443.

Privileged Mode *

Give the container privileged access. (Warning: use this option at your own risk as privileged containers can be dangerous)

true false

Environment Variables

Additional container environment variables. Example: example_var_1=123, example_var_2=123.

Entrypoint Override

Comma separated list which is used to override the command used to start a container. Example: ./test.sh,-v,-d,--human-readable

Memory

The maximum amount of memory the container can use in bytes. Set it as a positive integer, optionally followed by a suffix of b, k, m, g, to indicate bytes, kilobytes, megabytes, or gigabytes. The minimum allowed value is platform dependent (i.e. 6m). If left empty, the memory assigned to the container will be set to a default value by the native container orchestrator.

CPUs

Specify how many CPUs a container can use. Decimal values are allowed, so if set to 1.5, the container will use at most one and a half cpu resource.

GPUs

Specify how many Nvidia GPUs a container can use. Allowed values are 'all' or an integer number. If there's no Nvidia GPU installed, leave the field empty.

Volume Mount

The path on the container at which you would like to mount a file or folder. Example: /path/on/host1:/path/on/container1, /path/on/host2:/path/on/container2.

Peripheral Device

Used to pass physical devices to a container. Example: /dev/gpiomem, /dev/ttyUSB0. (Generally Requires privileged mode to be enabled)

Networking Mode

Used to specify what networking mode the container will use. Possible Drivers: bridge, none, container:{container id}, host. Note: This field is case-sensitive.

Logger Type *

Used to specify what logging driver the container will use. By default, containers will log to a JSON-FILE on the gateway.

Logger Parameters

Used to pass logger parameters to a container's logging driver. Example: max-buffer-size=4m, labels=location.

Restart Container On Failure *

Automatically restart the container when it has failed.

true false

Kura – MQTT comes built in

Services

Search +

Simple Artemis MQTT Broker

ActiveMQ Artemis Broker

BrokerInstance - Simple Artemis MQTT Broker

A simple MQTT broker instance based on Apache ActiveMQ Artemis

✓ Apply ✗ Reset 🗑 Delete

Enabled*
Enables the broker instance
 true false

MQTT address
The address the MQTT broker listens for incoming connections. Be sure to check if the firewall is configured correctly to allow access to this address.

MQTT port*
The port of the MQTT broker. Be sure to check if the firewall is configured correctly to allow access to this port.

User name
The user name required to access to the broker

Password of the user
The password required to connect. If the password is empty, no password will be required to connect.

ActiveMQ Artemis Broker instance, configured using XML

✓ Apply ✗ Reset 🗑 Delete

Enabled*
Enables the broker instance
 true false

Broker XML
Broker XML configuration. An empty broker configuration will disable the broker.

```
<?xml version="1.0" encoding="UTF-8"?>
<configuration xmlns="urn:activemq"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="
urn:activemq https://raw.githubusercontent.com/apache/activemq-artemis/master/artemis-server/src/main/resources/schema/artemis-server.xsd
urn:activemq:core https://raw.githubusercontent.com/apache/activemq-artemis/master/artemis-server/src/main/resources/schema/artemis-configuration.xsd
urn:activemq:jms https://raw.githubusercontent.com/apache/activemq-artemis/master/artemis-jms-server
```

Required protocols
A comma separated list of all required protocol factories (e.g. AMQP or MQTT)

User configuration*
User configuration in the format: user=password|role1,role2,...

Default user name
The name of the default user

Kura – Cloud Connectors

- Extendable
- MQTT is supported out of the box
- Can be used to broker a connection to the internal MQTT server (or any other MQTT server)
- Can be used to communicate with Kapua (send telemetry)
- Supports Concurrent Multi-Cloud Connections
- AWS, Azure

Cloud Connections

Setup connections to your preferred Cloud Platforms and manage publishers and subscribers.

+ New Connection	+ New Pub/Sub	🗑 Delete	🔌 Connect/Disconnect	🔄 Refresh
Service PID	Type	Status	Factory PID	
☁ org.eclipse.kura.cloud.CloudService	Cloud connection	Connected	org.eclipse.kura.cloud.CloudService	
↑ paymentPub	Publisher		org.eclipse.kura.cloud.publisher.CloudPublisher	
↑ tamperPub	Publisher		org.eclipse.kura.cloud.publisher.CloudPublisher	
☁ org.eclipse.kura.cloud.CloudService-2	Cloud connection	Connected	org.eclipse.kura.cloud.CloudService	
↓ paymentSub	Subscriber		org.eclipse.kura.cloud.subscriber.CloudSubscriber	

Kura - Drivers

- Extendable
- Add support for various protocols
- Can be even used for protocol conversion
- Field Protocols in vertical markets
 - Proprietary Protocols
 - Modbus
 - PLC

In our Demo

- Used the 'SenseHat Driver' from the Eclipse Market Place
- It Allows us to read & write the I²c bus from pi's GPIOs to communicate with sense hat

Kura – Drivers Cont.

Kura – Snapshots

The time machine that sci-fi movies always promised us.

- DeLorean not needed
- Allow us to reverse changes and go 'back in time'
- Allow us to apply configurations from other devices and go 'back to the future'
- Snapshots are in XML/JSON, can be easily customized and shared

Kura – Snapshots

Settings

Review and update the available system settings.

Deploy, Distribute and Scale

What is Eclipse Kapua?

Holistic and fully featured Approach to the Edge.

- IoT Cloud platform that integrates and manages IoT Gateways
- Manages the connectivity of IoT, and Edge gateways
- Supports many protocols MQTT, AMQP, and HTTP
- Sophisticated multi-tenant account management
- Easy data pipelines for collecting mass amounts of information from connected devices
- RESTful API for integration with custom applications
- intuitive web UI

Set the Scene – The Kura Candy Machine

Let's make a Candy machine with the following Criteria:

- ~~1. Accepts payment and dispenses something of value in return;~~
- ~~2. Detects when someone is trying to tamper with it;~~
3. Reports data back to the cloud (i.e. when a sale is made and if has been tampered with); and,
4. Is easily scalable so that the company can deploy as many machines as necessary.

Let's Put our Gumball machines all over the world

With Kura + Kapua you
can do the following...

Kapua – Device Connections

- Brokered via MQTT
- Does not require ports to be opened on the Edge device
- Edge devices are expected to not have the best network quality

[This Photo](#) by Unknown Author is licensed under [CC BY-SA](#)

Kapua – Configuration Service

Configure Edge settings from the cloud

The screenshot displays the Eclipse Kapua Configuration Service interface. At the top, there is a navigation bar with tabs for Description, Tags, Events, Inventory, Keystore, Configuration (selected), Assets, and Command. Below the navigation bar, there are action buttons for Refresh, Save, and Discard. The main content area is divided into a left sidebar and a right main panel. The sidebar lists various services, with 'Simple Artemis MQTT Broker' selected. The main panel shows the configuration for this service, including a description, a list of configuration items, and their values. The configuration items are: Enabled (true), Image name (geevo/nanopaymentconnector), Image tag (latest), Authentication Registry URL, Authentication Username, and Password. The interface also shows a page indicator 'Page 1 of 1' and 'Displaying 1 - 3 of 3 devices'.

In Summary

Kura

- Container Manager
- MQTT Server Built-in
- Cloud Connectors
- Drivers
- Snapshots
- Wires

Kapua

- Device Connections via MQTT
- Configuration Service
- Batch Jobs
- Data Collection

Conclusion

**Eclipse Kura and
Eclipse Kapua
treat EdgeOps
headaches better
than ibuprofen
because...**

- Handle the boring parts of IoT/Edge deployments
- Together Act as your backend
- Mature and Stable
- Provide Cutting Edge tools
- **Configured to Scale**
- **Enterprise Ready**

**Eclipse Kura and Eclipse Kapua can and
Will help you realize you Edge goals**

Check us out on GitHub

Thank you!

Special thanks to:

- Mattia, Pier, and Marcello for tech support & Coaching
- Salvatore, Nicola, Matteo and the rest of the ESF dev team & Eurotech
- Eclipse foundation for hosting this amazing event
- Finally, thank **you** for listening
